

# Spectral Clustering

# Graph Laplacian

Let  $G$  be a graph on  $n$  nodes. The Graph Laplacian is an  $n$  by  $n$  matrix given by :

$$L = D - A$$

Where  $D$  is the degree matrix and  $A$  is the adjacency matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 \end{bmatrix}$$

$$D = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 4 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 & 0 \\ 0 & 0 & 0 & 3 & 0 \\ 0 & 0 & 0 & 0 & 2 \end{bmatrix}$$

$$L = \begin{bmatrix} 1 & -1 & 0 & 0 & 0 \\ -1 & 4 & -1 & -1 & -1 \\ 0 & -1 & 2 & -1 & 0 \\ 0 & -1 & -1 & 3 & -1 \\ 0 & -1 & 0 & -1 & 2 \end{bmatrix}$$

## Symmetric Graph Laplacian

$$L^{\text{sym}} := D^{-1/2} L D^{-1/2} = I - D^{-1/2} A D^{-1/2},$$

Explicitly this is given by:

$$L_{i,j}^{\text{sym}} := \begin{cases} 1 & \text{if } i = j \text{ and } \deg(v_i) \neq 0 \\ -\frac{1}{\sqrt{\deg(v_i) \deg(v_j)}} & \text{if } i \neq j \text{ and } v_i \text{ is adjacent to } v_j \\ 0 & \text{otherwise.} \end{cases}$$

# Eigenvalues and Eignenvector of a matrix

Watch this lecture for a [review](#) of the concepts of the eigenvalues and eigenvectors

Matrix-vector multiplication

$$\overbrace{A\vec{v}} = \underbrace{\lambda\vec{v}}$$

Scalar multiplication

Fix different multiplication types

The image shows a black background with white text. At the top left, it says 'Matrix-vector multiplication'. Below that is the equation  $A\vec{v} = \lambda\vec{v}$ . A white bracket is above the  $A\vec{v}$  part, and another white bracket is below the  $\lambda\vec{v}$  part. Below the equation, it says 'Scalar multiplication'. At the bottom center, there is a cartoon character with a long, thin body and large eyes, looking up. To the right of the character is a speech bubble containing the text 'Fix different multiplication types'.

# Eigenvalues and Eignenvector of a symmetric matrix

A squared matrix is symmetric if  $A = A^T$

# Eigenvalues and Eignenvector of a symmetric matrix

A squared matrix is symmetric if  $A = A^T$

$$\begin{bmatrix} 3 & 2 & 5 \\ 2 & 5 & 4 \\ 5 & 4 & 7 \end{bmatrix}$$

Symmetric

$$\begin{bmatrix} 5 & 1 & 3 \\ 2 & 0 & 2 \\ 0 & 1 & 5 \end{bmatrix}$$

Non-symmetric

# Eigenvalues and Eignenvector of a symmetric matrix

A squared matrix is symmetric if  $A = A^T$

$$\begin{bmatrix} 3 & 2 & 5 \\ 2 & 5 & 4 \\ 5 & 4 & 7 \end{bmatrix}$$

Symmetric

$$\begin{bmatrix} 5 & 1 & 3 \\ 2 & 0 & 2 \\ 0 & 1 & 5 \end{bmatrix}$$

Non-symmetric

Symmetric matrices are very important in engineering and the solution of many problems come down to finding eigenvectors and eigenvalues for some symmetric matrix

# Eigenvalues and Eignenvector of a symmetric matrix

A squared matrix is symmetric if  $A = A^T$

$$\begin{bmatrix} 3 & 2 & 5 \\ 2 & 5 & 4 \\ 5 & 4 & 7 \end{bmatrix}$$

Symmetric

$$\begin{bmatrix} 5 & 1 & 3 \\ 2 & 0 & 2 \\ 0 & 1 & 5 \end{bmatrix}$$

Non-symmetric

Symmetric matrices are very important in engineering and the solution of many problems come down to finding eigenvectors and eigenvalues for some symmetric matrix

If  $A \in R^{n \times n}$  is a symmetric matrix then it has an orthonormal set of eigenvectors  $u_1, u_2, \dots, u_n$  corresponding to (not necessarily distinct) eigenvalues  $\lambda_1, \lambda_2, \dots, \lambda_n$

# Eigenvalues and Eignenvector of a symmetric matrix

A squared matrix is symmetric if  $A = A^T$

$$\begin{bmatrix} 3 & 2 & 5 \\ 2 & 5 & 4 \\ 5 & 4 & 7 \end{bmatrix}$$

Symmetric

$$\begin{bmatrix} 5 & 1 & 3 \\ 2 & 0 & 2 \\ 0 & 1 & 5 \end{bmatrix}$$

Non-symmetric

Symmetric matrices are very important in engineering and the solution of many problems come down to finding eigenvectors and eigenvalues for some symmetric matrix

If  $A \in R^{n \times n}$  is a symmetric matrix then it has an orthonormal set of eigenvectors  $u_1, u_2, \dots, u_n$  corresponding to (not necessarily distinct) eigenvalues  $\lambda_1, \lambda_2, \dots, \lambda_n$

Solve its eigenvalues

All of them are going to be real and non-negative

# Eigenvalues and Eignenvector of the Laplacian

We can think about a mesh as a graph. We can compute the eigenvalues  
And eigenvectors of the Laplacian of this graph

# Eigenvalues and Eignenvector of the Laplacian

We can think about a mesh as a graph. We can compute the eigenvalues  
And eigenvectors of the Laplacian of this graph

The first 10  
eigenvectors of  
this mesh

# Eigenvalues and Eignenvector in Python

In python you can compute the eigenvalues and the eigenvectors of a matrix : [numpy.linalg.eig](https://numpy.org/doc/stable/reference/generated/numpy.linalg.eig.html)

# From the data to the graph

Given the data  $X = \{p_1, p_2, \dots, p_n\}$ , we begin by constructing a graph  $G$  on the top of the data  $X$ :

- The points in  $X$  are the vertices of the graph
- The edges in the graph and their weights are determined by how close together and are in  $X$

Three common methods to construct graphs :

- The neighborhood graphs ( $\varepsilon$  – neighborhood graph or the knn graph)
- The complete graph on the set  $X$ .

## Similarity Graph: $\epsilon$ - Neighborhood Graph

*Construct the  $\epsilon$  – neighborhood graph*

A common problem here is which  $\epsilon$  we should choose?

# Similarity Graph: KNN Graph

Example of 1-NN graph

Example of 2-NN graph

Example of 3-NN graph

# Similarity Graph: The fully connected graph

Suppose that we are given a set of points  $X = \{p_1, p_2, \dots, p_n\}$  in  $R^d$ . Another way to construct a graph on the top of the data X is by connecting all points in X to each other. In this case we weight all edges by  $s_{ij} := s(x_i, x_j)$  defined as follows :

$$s(x_i, x_j) = \exp\left(-\frac{\|x_i - x_j\|^2}{2\sigma^2}\right)$$

Consider the digit dataset. This dataset can be thought of as a high-dimensional data with  $d = 64$ .

## Spectral Embedding : general steps

- Construct a similarity graph phase : A similarity graph for the data  $X$  is chosen from the many available neighborhood graphs we studied in earlier lectures.
- The spectral embedding phase :In this step we use the eigenvectors of the Laplacian of the similarity graph to construct new coordinates.

## Spectral Embedding : Algorithm

Input : a data set  $X$  consists of  $n$  points in  $R^d$ . The number of dimensions  $k \leq d$

## Spectral Embedding : Algorithm

Input : a data set  $X$  consists of  $n$  points in  $R^d$ . The number of dimensions  $k \leq d$

- Construct a similarity graph  $G=G(X)$  of the data. This can be the  $k$ -NN graph for instance.

## Spectral Embedding : Algorithm

Input : a data set  $X$  consists of  $n$  points in  $R^d$ . The number of dimensions  $k \leq d$

- Construct a similarity graph  $G=G(X)$  of the data. This can be the  $k$ -NN graph for instance.
- Compute the Laplacian of the graph  $L(G)$ .

## Spectral Embedding : Algorithm

Input : a data set  $X$  consists of  $n$  points in  $R^d$ . The number of dimensions  $k \leq d$

- Construct a similarity graph  $G=G(X)$  of the data. This can be the  $k$ -NN graph for instance.
- Compute the Laplacian of the graph  $L(G)$ .
- Compute top  $k$  eigenvectors of  $L$  and place them as columns in a matrix  $V$

## Spectral Embedding : Algorithm

Input : a data set  $X$  consists of a points in  $R^d$ . The number of dimensions  $k \leq d$

- Construct a similarity graph  $G=G(X)$  of the data. This can be the k-NN graph for instance.
- Compute the Laplacian of the graph  $L(G)$ .
- Compute top k eigenvectors of  $L$  and place them as columns in a matrix  $V$

## Spectral Embedding : Algorithm

Input : a data set  $X$  consists of a points in  $R^d$ . The number of dimensions  $k \leq d$

- Construct a similarity graph  $G=G(X)$  of the data. This can be the k-NN graph for instance.
- Compute the Laplacian of the graph  $L(G)$ .
- Compute top k eigenvectors of  $L$  and place them as columns in a matrix  $V$
- Form  $W$  from  $V$  by normalizing the rows of  $W$  (making every row a unit vector).

$$v_{ij} = \frac{u_{ij}}{(\sum_{l=1}^k u_{il}^2)^2}$$

## Spectral Embedding : Algorithm

Input : a data set  $X$  consists of  $n$  points in  $R^d$ . The number of dimensions  $k \leq d$

- Construct a similarity graph  $G=G(X)$  of the data. This can be the k-NN graph for instance.
- Compute the Laplacian of the graph  $L(G)$ .
- Compute top  $k$  eigenvectors of  $L$  and place them as columns in a matrix  $V$
- Form  $W$  from  $V$  by normalizing the rows of  $W$  (making every row a unit vector).
- Each row  $w_i$  in the matrix  $W$  is, by definition, the spectral embedding of the point  $x_i$  from the original data

## Spectral Clustering/Embedding: remarks

Spectral clustering does not put any assumption on the shape of data.

Spectral clustering can be used to for clustering non-linearly separable data.

The results of spectral embedding can better reveal or exaggerate useful underlying structures in the input data.
